WILL FORD

Computer Science Student · Software Engineering
Plymouth · william.ford.wf2002@gmail.com · LinkedIn · github.com/fordyyyx · fordyyyx.github.io

PROFILE

First-year Computer Science student at the University of Plymouth with a strong mathematical foundation from Imperial College London and a growing portfolio of software projects in Python, C++, JavaScript, and TypeScript. I enjoy building things end to end — from object-oriented design to automated testing and continuous integration — and am seeking a summer 2027 internship or placement in software engineering that can grow into a graduate role. I also bring a data background, with SQL certification and analysis projects, and three years' experience leading shift teams at Tesco.

EDUCATION

University of Plymouth — BSc (Hons) Computer Science *Sept 2026 – Present*

Imperial College London — Certificate of Higher Education, Mathematics *Oct 2021 – May 2023*

- Two years of the integrated Master's (MSci) Mathematics programme, including linear algebra, real and complex analysis, statistics, programming, and network science. Awarded **93%** for an independent research project.

A-Levels: Further Mathematics (A*), Mathematics (A*), Physical Education (A) **GCSEs:** 8 at grade 8–9

TECHNICAL SKILLS

Languages: Python (strongest), working knowledge of HTML, CSS, and SQL; currently learning JavaScript, TypeScript, C, and C++

Engineering Practice: Object-oriented design, unit testing (pytest), continuous integration (GitHub Actions), static type checking, and agile delivery

Tools: Git and GitHub, VS Code, Pylance, and Power BI

Foundations: Linear algebra, statistics, network science, and mathematical problem-solving

Certifications: DataCamp Data Analyst Associate (SQL); web development certification (HTML and CSS)

PROJECTS

Descent from Olympus — Python RPG · GitHub *2026 – ongoing*

- Text-based Greek mythology dungeon crawler in pure Python, featuring turn-based team combat, spells, status effects, an inventory system, and recruitable AI-controlled companions.
- Designed a utility-based enemy AI that scores possible actions (attack, defend, brace, and heal) to choose tactics in multi-character combat.
- Structured as a professional codebase: object-oriented class hierarchy, src layout with pyproject.toml, a pytest suite run across Python 3.10–3.12 on every push through GitHub Actions CI, and static type checking.

Freightline — TypeScript logistics tycoon game · Freightline · GitHub *Oct 2026 – in development*

- Browser-based game on a real-world map in which players grow a local delivery firm into a global distribution network; built solo as product owner and developer, planned in agile sprints, with a first playable release due in December 2026.

University Coursework *2026 – in progress*

- Grocery inventory management system (C++): console application built around a custom Product class, with planned extensions including automated order generation and a simulated day of sales.
- Market stall idle game (HTML, CSS, and JavaScript): single-page browser game where players grow a market stall into a global business, with a "franchise" prestige loop; delivered in two-week agile sprints.

Earlier Projects

- Formula One championship tracker (Python), data analysis of Marvel film and personal Strava datasets (SQL), and a personal portfolio website hosted on GitHub Pages.

EMPLOYMENT

Tesco — Shift Leader *Oct 2023 – Sept 2026*

- Promoted from Customer Assistant within two months; led shift teams in a high-volume store with a multi-million-pound annual turnover, balancing competing priorities under time pressure.
- Solved operational problems as they arose, used sales and stock data to guide ordering and reduce waste, and communicated clearly with colleagues and customers.

ACTIVITIES

- University of Plymouth American football team: running back, training twice a week alongside Sunday fixtures.
